BUILDING PRODUCTS

### Other Rebar Continuity Systems

Ancon manufactures other reinforcement continuity systems for use when bar diameters exceed 16mm, lap lengths do not fit within an Eazistrip box and on-site bar straightening is keen to be avoided.

### KSN Anchor System

Here, Ancon KSN threaded anchors are supplied fixed to a galvanised steel casing and used in conjunction with Bartec parallel threaded reinforcing bars. Standard anchors are available to accept bars of 12mm, 16mm and 20mm diameter in a lap length to suit the application.

### Starter Bar System

This system consists of a Starter Bar which is supplied fixed to an Ancon tapered thread coupler to accept a tapered threaded continuation bar. The Starter Bar can also be supplied with an Ancon Parallel Thread Adaptor which accepts a standard metric bolt or studding. The standard range suits bar diameters up to 32mm.

**Eazistrip**

**Ancon designs and manufactures high integrity steel products for the construction industry. Through continuous programmes of new product development, inward investment and employee advancement, the company is committed to maintaining the highest level of customer service within a dynamic and challenging industry.**

The use of reinforcement continuity systems is a widely accepted means of providing continuity of reinforcement across construction joints in concrete. The Eazistrip system comprises a galvanised steel casing which houses pre-bent bars. The unit is cast into the face of a concrete wall and the bars are straightened, ready for lapping when required.

Masonry Support Systems	Eazistrip Reinforcement Continuity Systems	4

# Eazistrip

## EAZISTRIP REINFORCEMENT CONTINUITY SYSTEMS

The Eazistrip Reinforcement Continuity System is a quick and easy to install method of maintaining continuity of reinforcement at construction joints in concrete. It consists of a galvanised steel casing with a dimpled surface to provide an effective concrete bond. Pre-bent bars are housed within the casing and are enclosed by a protective cover. Each end of the unit is sealed with a polystyrene block in order to prevent the ingress of concrete.

The complete unit is nailed to the formwork. Alternatively it can be wired back to the main reinforcement cage. The concrete is then cast. After striking the formwork, the cover is removed and the bars are straightened, ready for lapping onto the main reinforcement, using an Eazistrip re-bending tool.

The steel casing remains embedded in the wall and is filled with concrete when the next section is poured, the dimpled surface providing an efficient key.

Use of the Eazistrip system offers many benefits over conventional joint construction, including the simplification of formwork design and removal of the need to drill shuttering. This contributes to the acceleration of the construction process. As the bars remain enclosed within the casing until required, they are protected and the risk of injury from projecting bars is minimised. Easy to use, the system requires little on site training in order to carry out installation.

The Eazistrip system is potentially suitable for use in any construction joint in concrete, but the most commonly found applications include:

- Floor slabs
- Walls
- Stairwells
- Corbels
- Diaphragm walls
- Jumpforms
- Brick support ledges

## EAZISTRIP COVERS

Ancon is phasing out the use of steel covers on Eazistrip systems, replacing them with a heavy duty plasticised cardboard alternative. User feedback suggests these covers are quicker and safer to remove than those manufactured from steel.

Currently all 10mm and 12mm systems are supplied with a cardboard cover. The 16mm system will be supplied with steel covers in the short term, however should you require this system with a cardboard cover please advise Ancon at the time of ordering.

## QUALITY ASSURANCE

Eazistrip Reinforcement Continuity Systems are manufactured using CARES approved bar. The type of reinforcement is selected by Ancon Building Products to provide a suitable degree of ductility, ensuring that it complies with the tensile requirements of BS4449: 2005 Grade B500C after prefabrication and re-bending on site. The bars are bent in accordance with BS8666: 2005.

It is the designer's responsibility to ensure reinforcement is adequately designed in accordance with the code and detailed to ensure anchorages and bearing stresses are appropriate. Ancon Building Products is a BS EN ISO 9001 registered company.

Ancon Eazistrip is approved by UK CARES.

**TECHNICAL  
APPROVAL**

5017

Eazistrip Reinforcement Continuity Systems are suitable for use with designs undertaken in accordance with BS EN 1992-1-1: 2004 (Eurocode 2) and BS 8110-1: 1997.

**STANDARD RANGE CONFIGURATIONS**

**Type 80**

**Type 110H**

**Type 110U**

**Type 140**

**Type 160**

**Type 190**

**Type 240**

When the stirrup width exceeds 220mm, units will be supplied as two single overlapping hooks, to be positioned side by side.

150mm\* Centres

200mm\* Centres

\*Other centres are available

**Notes:** Units containing 16mm bars are nominally 50mm deep. On 16mm Ø Type U boxes, the stirrup may be achieved using two shape code 21 bars. These are referenced DH.

# Eazistrip Reinforcement Continuity Systems

## STANDARD RANGE SPECIFICATIONS

The following tables give details of the Eazistrip standard ranges. Many customers require purpose made units to suit their particular application. In order to meet this requirement Ancon will manufacture according to your specific bar arrangement. The most common shapes are shown on page 10. For further details please contact Ancon Building Products.

**Notes:** Dimensions shown in the above table are nominal. Heights and lengths may typically vary by one bar diameter. Maximum box length is 3m dependant upon weight. Boxes with a DH reference contain double hook bars rather than a single U bar. Units containing 16mm bars are nominally 50mm deep (d).

### RADIUSED EAZISTRIP

Many of the units detailed in the brochure are available radiused. Please contact Ancon with your requirements.

# Eazistrip Reinforcement Continuity Systems

## INSTALLATION

Nail the Eazistrip through the casing to the formwork or alternatively securely tie the projecting anchorage reinforcing bars back to the main reinforcement. In both cases the Eazistrip box should be securely fixed to avoid displacement during concreting. The casing should be tight against the formwork. Pour concrete.

Strike the formwork to reveal the cover.

Remove the cover to expose the pre-bent bars.

Straighten the bars using the appropriate sized Ancon Eazistrip re-bending tool for the size of bar. The bars should be straightened only once. To avoid damage to adjacent concrete, it is prudent to allow a concrete curing period of seven days. See 'Bar Straightening' for more information.

Once the bars are straightened and aligned they are ready for lapping with the concrete element reinforcement, provided by others.

## BAR STRAIGHTENING

The bars in the Eazistrip box must be straightened using the appropriate sized Ancon Eazistrip re-bending tool. This is a steel tube designed to fit over the bar, the internal diameter being slightly larger than the maximum dimension over the ribs of the bar. One end of the tube has a section cut away; this provides support to the outside of the bend during straightening of the bar and limits the point contact of the tube on the bar.

Use of the tool allows the re-bending process to be carried out in a smooth continuous action (avoiding jerky action), the tube being moved along the bar and around the bend as it is straightened. Scaffold tubes or similar must not be used to straighten bar.

To enable the re-bending tool to be fitted onto the bar, the bar should be pulled the minimum distance from the Eazistrip steel casing to enable this. The re-bending tool should then be slid along the bar to the start of the bend radius.

The bar straightening process should be smooth and progressive with the tube allowed to move along the bend towards the metal casing as it is straightened. The tool should contact the Eazistrip steel casing at the completion of the straightening process.

The tube is then removed and the straightened bar checked for alignment and cover with the adjoining reinforcement.

The Eazistrip reinforcing bars should not be straightened when the temperature of the steel is below 5°C. Where straightening is necessary below 5°C, indirect warming of the steel to a temperature not exceeding 100°C is permitted.

The use of scaffold tubes, or other inappropriate tools will result in excessive kinks in the region of the bar bend and result in undesirable work hardening which may damage the bar and affect the strength of the bar. Re-bending must be undertaken using only the Ancon Eazistrip re-bending tool. Bending the bar in excess of the recommendations will also result in work hardening of the rebar and should therefore be avoided.

Scan the code to watch an installation video.

## ON-SITE CUTTING

1

Identify the location of the intended cut.

2

Slide the protective cover from the box and remove the bars which pass over the cut location.

3

Cut through the steel casing using a disc cutter.

4

Replace the bars to face the opposite direction to their original position. Cut the cover to the same lengths as the steel casing and replace to protect the bars. The ends of the boxes must be sealed, using polystyrene blocks, to prevent the ingress of concrete.

**Note:** Protective gloves should be worn when removing covers, straightening bars, cutting boxes and during general handling of Eazistrip.

## EAZISTRIP WATER STOP

Where the potential for water ingress through the construction joint is a major concern, Eazistrip can be supplied with a Pentaflex hydrostatic seal. The seal is factory fitted inside and outside the box to provide double-sided protection against water or moisture permeation along the joint face.

As Pentaflex is a hydrostatic seal, it is not reliant on expansion, unlike hydrophilic type seals, and it provides a continuous elastic seal by means of the bond between the Pentaflex and the fresh concrete. Resistant to organic waste water, Pentaflex has been tested by the Hygiene-Institut, Geisenkirchen, Germany for use with potable water.

A protective film on the Pentaflex prevents contamination by dust or dirt during storage, handling and installation. The film must be removed prior to concreting. When installing and abutting boxes, joints are achieved by pressing together a 50mm overlap of the Pentaflex material, to ensure continuous protection against water permeation.

## OTHER ANCON PRODUCTS

### Reinforcing Bar Couplers

The use of reinforcing bar couplers can provide significant advantages over lapped joints. Design and construction of the concrete can be simplified and the amount of reinforcement required can be reduced. The Ancon range includes parallel-threaded, tapered-threaded and mechanically bolted couplers.

### Shear Load Connectors

Ancon DSD Shear Load Connectors are used to transfer shear across expansion and contraction joints in concrete. They are more effective at transferring load and allowing movement to take place than plain dowels, and can be used to eliminate double columns at structural movement joints in buildings.

### Channel and Bolt Fixings

Ancon offers a wide range of channels and bolts in order to fix stainless steel masonry support, restraints and windposts to structural frames. Cast-in channels and expansion bolts are used for fixing to the edges of concrete floors and beams.

### Insulated Balcony Connections

Ancon Isolan connectors join external concrete balconies to internal concrete floor slabs. Used to minimise cold bridging, they provide continuity to the thermal insulation. Standard systems, comprising rigid CFC-free polystyrene insulation and duplex stainless steel shear reinforcement, suit most depths of cantilevered and simply supported balconies. Conventional reinforcing bars are used to provide the tension and compression reinforcement.

### Punching Shear Reinforcement

Ancon Shearfix is used within a slab to provide additional reinforcement from punching shear around columns. The system consists of double-headed steel studs welded to flat rails and is designed to suit the load conditions and slab depth at each column using free calculation software from Ancon.

### Special Stainless Steel Fabrications

Ancon has a wealth of experience in working with different types and grades of stainless steel. Advanced manufacturing facilities enable one-off or volume orders to be fabricated to individual project requirements and to exacting quality standards. Considerable material stocks are maintained in order to meet urgent delivery deadlines.
